Laser-Beam Approach to SAT Prep

Many students need to focus on a narrowly defined area to increase their SAT or ACT scores. Instead of spending their time and effort on Critical Reading, Math, and Writing to raise their SAT scores, they need to take a “laser-beam” approach to just one area or type of problem or question. A student might have difficulty solving critical thinking word problems. Another student might do well on the reading passages but have difficulty with the hard Sentence Completions because of a lack of college-level vocabulary. On the ACT, a student might have difficulty with just the Science section while another might have difficulty finishing the Math Section in 60 minutes. All of these students need to prepare for their re-takes by focusing on specific areas of weakness like a laser beam. The summer is an ideal time to undertake this intense, but restricted focus.

The ***Laser-Beam*** approach includes an analysis of previous tests, an interview with the student, design of an instructional program, one-on-one instruction and a test at the end of the instructional cycle.
